Project Name	**Insurance Fraud Detection Using Machine Learning**
Maximum Marks	4 Marks

Empathy Map Canvas:

User

User

- Insurance company staff, claim investigators, and insurance claimants
- Insurance company taff, claim investigators, insurance claimants

What the User Says

- "We need a faster way to detect fraudulent claims."
- "Manual verification takes too much time."
- "Fraud cases cause huge financial losses."

What the User Feels

- **Frustrated** due to increasing fraud cases.
- Large amount of financial losses.
- Needs a reliable system for quick decision making.
- High risk of missing fraudulent claims.

What the User Thinks

- There must be a smarter way to detect fraud automatically.
- Machine learning can help identify suspicious claims.
- The system should be accurate and reliable.

Pain Points

- Manual fraud detection is slow and inefficient.
- Large amount of claim data is difficult to analyze manually.
- High risk of missing fraudulent claims.

What the User Does

- Submits insurance claim details.
- Investigates suspicious claims manually.
- Reviews claim history and customer data.

User Needs / Goals

- Automatic fraud detection system.
- Accurate prediction of fraudulent claims.
- Faster claim verification process.
- Reduce financial losses caused by fraud.

What the User Feels

- Frustrated due to increasing fraud cases.
- Large amount of financial losses.
- High risk of missing fraudulent claims.

Possible Solutions

- Implement machine learning models like Random Forest.
- Use historical claim data to train the model.
- Build a web application for claim submission and fraud detection.
